

Examples on Equivalence Class Partition-Based Testing

**Durga Prasad Mohapatra
NIT Rourkela**

Example-1: Intersection of two straight lines

- Q. Design B-B test cases for the following program:

The program checks if 2 straight lines intersect and print their point of intersection.

Ans: The straight line may be represented as: $y = mx + c$

Straight lines are given in the form of (m_1, c_1) and (m_2, c_2) .

Equivalent classes are as follows:

- ✓ Case 1: The lines are parallel i.e. $m_1 = m_2$
So points are (1, 2) and (1, 5)
- ✓ Case 2: Coincident lines i.e. $m_1 = m_2$ and $c_1 = c_2$
And points are (2, 3) and (2, 3)

1

2

Example-1 Contd.

- ✓ Case 3: Lines intersecting at one point i.e. $m_1 \neq m_2$

The points may be (2, 5) and (3, 6).

So there are 3 valid equivalent classes. You may include one more valid equivalent classes

There are no boundary values here.

So, the resultant test suite is:

{{(1, 2),(1, 5)}, {(2, 3),(2, 3)} {(2, 5),(3, 6)}}.

3

Example-2: Solving quadratic equations

- Q. Design B-B test cases for the following program:

The program solves quadratic equations of the form

$$ax^2 + bx + c$$

It accepts 3 floating point values as input and gives the roots, e.g. The input may be (7.7, 3.3 and 4.5).

Ans: Equivalent Classes are as follows:

- $b^2 = 4ac$ inputs are: $a=2.0, b=4.0$ and $c=2.0$
- $b^2 > 4ac$ inputs are $a=2.0, b=5.0$ and $c=2.0$
- $b^2 < 4ac$ inputs are $a=2.0, b=3.0$ and $c=2.0$
- Invalid Equation inputs are $a=0, b=0$ and $c=10.0$

Write down the test cases accordingly.

4

Example-3: Solving linear equations

- Q. Design B-B test cases for the following program:

The program solves linear equations in upto 10 independent variables

e.g. $5x+6y+z=5$

$10x+2y+5z=20$

.....

.....

Example-3 Contd.

- Ans: Equivalent Classes are as follows:

i. Valid Equivalent Classes

- Many Solution (# var < #eqns)
- No Solution (# var > #eqns)
- Unique Solution (# var = #eqns)

ii. Invalid Equivalent Classes

- Too many Variables (# var > 10)
- Invalid Equation (# var = 0)

Write down the test cases accordingly.

5

6

Example-4: Intersection of two circles

- Q. Design B-B test cases for the following program:

The program finds the points of intersection of 2 circles

- Ans: Equivalent Classes are as follows:

- i. $r_1 + r_2 < \text{distance between}(x_1, y_1) \text{ and } (x_2, y_2)$ i.e. not intersecting
- ii. $r_1 + r_2 = \text{distance}$ i.e. touching at 1 point
- iii. $r_1 + r_2 > \text{distance}$ i.e. intersecting at 2 points
- iv. $\text{Distance} = 0$ and $r_1 = r_2$ i.e. overlapping
- v. $\text{Distance} = 0$ and $r_1 \neq r_2$
- vi. Invalid circles

Write down the test cases accordingly.

7

Example-5: Query Book Option in LIS

- Q. Design B-B test cases for the option **Query Book** using a Keyword (e.g. Author name or title).

Ans: The equivalent classes and the corresponding test cases are as follows:

- Not present in catalogue (SE, not present)
- Present in catalogue (SE, present, 15 issued, not available)
- Present in catalogue (SE, present, 10 issued, 5 available)
